

NEW COMPOUNDS CAPABLE OF INHIBITING HIV-1 INFECTION

Abstract of the Disclosure

This invention provides an antibody capable of specifically inhibiting the fusion of an HIV-1 envelope glycoprotein* cell with an appropriate CD4* cell without cross reacting with the HIV-1 envelope glycoprotein or CD4 and capable of inhibiting infection by one or more strains of HIV-1. This antibody is then used to identify a molecule which is important for HIV infection. Different uses of the antibody and the molecule are described.
